PROJECT SUMMARY (Purpose, Nature, Expected Duration, etc.)

Historic site assessment studies suggest that limited disposal of hazardous constituents occurred on the property during prior ownership. Studies conducted in 1985-1987 indicated the presence of barium and chlorinated hydrocarbons in groundwater at levels exceeding the Reportable Concentrations. Recent groundwater sampling and analysis have shown that natural attenuation and degradation have reduced all toxic metal and VOC constituents to below MCP action levels except vinyl chloride. Continued monitoring will be required to assess the need for further remedial actions to ensure a level of No Significant Risk to health, safety, public welfare and the environment.
